

Rank-Order Model of Grey Whales Locations and Suitable Habitat Variables

The distribution of Grey Whales is correlated to their feeding grounds and other habitat variables. The rank-order model consists of the level of suitability for whale habitat, as well as the number of satisfied variables at the coastline of Flores Island. The three habitat variables are, the bathymetry depth, seafloor complexity, and the distance from shore. Grey Whales are spotted at areas that have more habitat variables met as primary food sources are dominated in shallow water.

Bathymetry Depth and Grey Whales at the Coastline of Flores Island
